Charging current should be less than maximum charge current specified in the Product Specification. Charging with higher current than recommended value may cause damage to cell electrical, mechanical, and safety performance and could lead to heat generation or leakage.

充电电流应小于规格书中的最大充电电流. 采用高于推荐值的电流充电会损坏电芯的电性能, 机械性能和安全性能或导致发热和泄漏。

1.2 Charging voltage: 充电电压

Charging shall be done by voltage less than that specified in the Product Specification (4.2V/cell). Charging beyond 4.25V, which is the absolute maximum voltage, must be strictly prohibited. The charger shall be designed to comply with this condition.

It is very dangerous that charging with higher voltage than specified value may cause damage to the cell electrical, mechanical safety performance and could lead to heat generation or leakage.

充电电压应低于产品规格书中规定的 4.2V. 严禁充电到最大电压 4.25V. 充电器应当在此条件下设计. 采用高于指定值的电压来充电时非常危险的, 可能损坏电芯的电性能, 机械性能和安全性能或导致发热和泄漏。

1.3 Charging temperature:充电温度

The cell shall be charged within the specified temperature range in the Product Specification.

电芯充电应当在产品规格书中指定的温度范围内充电。

1.4 Prohibition of reverse charging:禁止反充

Reverse charging is prohibited. The cell shall be connected correctly. The polarity has to be confirmed before wiring. In case of the cell is connected improperly, the cell cannot be charged. Simultaneously, the reverse charging may cause damaging to the cell which may lead to degradation of cell performance and damage the cell safety, and could cause heat generation or leakage.

2.3 Over-discharging/过放

It should be noted that the cell would be at an over-discharged state by its self-discharge characteristics in case the cell is not used for long time. In order to prevent over-discharging, the cell shall be charged periodically to maintain between 3.7V and 3.9V.

需要注意的是, 在电芯长时间未使用期间, 它可能会用其自放电特性而处于某种过放电状态. 为防止过放电的发生, 电芯应定期充电, 将其电压维持在 3.7V 至 3.9V 之间.

Over-discharging may causes loss of cell performance, characteristics, or cell functions. The charger shall be equipped with a device to prevent further discharging exceeding a cut-off voyage specified in the Product Specification. Also the charger shall be equipped with a device to control the recharging procedures as follows:

The cell pack shall start with a low current (0.01C) for 15 - 30 minutes, i.e. pre-charging, before rapid charging starts. The rapid charging shall be started after the individual cell voltage has been reached above 3V within 15 - 30 minutes that can be determined with the use of an appropriate timer for pre-charging.

In case the individual cell voltage does not rise to 3V within the pre-charging time, then the charger shall have functions to stop further charging and display the cell/pack is at abnormal state.

过放电会导致电芯性能、电池功能的丧失。

充电器应有装置来防止电池放电至低于本标准规定的截止电压。此外, 充电器应有装置已放在重复充电, 步骤如下:

电池在快速充电之前, 应先以小电流 (0.01C) 预充电 15~30 分钟, 以使 (每个) 电芯的电压达到 3V 以上, 再进行快速充电。可用一计时器来实现该预充电步骤。如果在预充电规定时间内, (个

别) 电芯的电压仍未升到 3.0V 以上, 充电器应能够停止下一步快速充电, 并显示该电芯/电池正处于非正常状态。

7.3 Storage 存放

The cell should be stored within the proper voltage and temperature range specified in the Product Specification.

电芯应当在产品规格书中指定的电压和温度范围内存放。
